• Interrelationship of building and surroundings:

The site is located on the west side of Kent Road South (US Route 7) at the northern edge of the Bulls Bridge District of Kent (named for the 19th-century school district) and forms a striking southern gateway to Kent Village. The total size of the site is 14.22 acres, bordered by the road and by the Housatonic River. Two barns are located in a north-south line with their ridge-lines parallel to the road which runs slightly easterly of north-south as it heads toward Kent Village to the north. The South Barn served as a residence and later as a glass-blowing studio prior to its acquisition in 1996 by the Kent Land Trust.

The South Barn is now used as a residence and the offices for the Kent Land Trust. The North Barn is used for agricultural purposes. Adjacent to the northeast of the North Barn is a concrete stave silo. West of the North Barn there is a metal-framed plastic-covered hoop house. To the southwest of the barn structures is a small parking lot, which is accessed by a gravel driveway further to the southwest. Both barns front Kent Road, although the North Barn is set closer to the road.

The South Barn office/residence is a 1 ½-story Dutch gambrel-roofed barn, approximately 27’ x 49’, with a banked basement level. Grade slopes down toward the west exposing the basement level. Mortared fieldstone foundations and some new concrete walls are visible on the north and south gable-ends. The main level and attic gable walls are vertical wood siding; a number of residential casement and picture windows are installed in the main level and attic gables. There is a porch and steps from an entry door in the west side, and another entry door in the east side off-center toward the right. Modern picture and casement windows have been installed, utilizing many of the opening locations in which windows had been inserted by the previous users.

The roof is asphalt shingles; there is a projecting hay hood in the south ridge of the roof and a shed dormer in the west pitch of the roof. A split-rail fence along the edge of the roadway borders the property adjacent to the South Barn.

To the west the site slopes down into the river floodplain. To the north of the barns is a large planting area. Birch Hill Lane, a street of narrow river-front lots with small homes, borders the northwest portion of the property. The area surrounding the site is scattered residential, active agriculture, open space and woodland on the hillside sloping up to the east. Bulls Bridge, listed on the National Register of Historic Places, is 1.5 miles south and is a covered bridge crossing the Housatonic River. The town center of Kent is approximately 2.5 miles to the north along US Route 7; a mile further north is the Kent Iron Furnace, listed on the National Register, and a mile north is the Flanders National Register Historic District.

North Barn:

This is a 1 1/2-story extended English bank barn five bays in length, 30’ x 70’, with a shed-roofed addition and a lean-to. The main eave-side faces roughly east and the ridge-line of the barn is parallel to the road. Siding is vertical boards painted red; roofing is asphalt shingles.

Exterior:

The barn has two main entries; two pairs of full-height exterior sliding doors on the east eave-side. The entries are in the second and fourth bays. The grade declines sharply at the south corner, revealing a basement level in the south gable-end of the barn. A stone retaining wall extends to the south. The south gable-end has a centered pair of hinged doors in the basement level. To the west is an exterior sliding door. A horizontal trim board separates the basement level from the main level. The rest of the southwest gable-side of the barn is blank except for an arch-
topped louvered vent with trim beneath the apex of the roof and "The Kent Land Trust" logo in black paint, centered on the main level and gable attic. The south gable-end of a shed Milk room addition is flush with the south end wall and has a hinged door in its right half.

The west eave-side of the barn has the 1-story shed-roofed Milk room addition extending to the west at the right (south) corner of the side, covering one bay of the main barn, and an open lean-to extending to the west at the left (north) corner. Above the lean-to is a set of two six-pane windows. Under the lean-to roof there is a hay door into the main barn and a sliding barn door into the basement level. In the center bay area of the main block is a pair of sliding hinged hay doors on the main level and a metal-framed glazed opening at the basement level.

The grade at the north corner inclines to the main level. A foundation wall, of mortared fieldstone, extends to the northwest at the north corner and becomes the north wall of the lean-to. It has a nine-pane stable-type window set into the masonry, and a wood-sided gable-end above. Under the lean-to is a concrete floor slab. The northeast gable-end of the barn is blank except for a modern two-pane sliding window towards the east corner on the main level and an arch-topped vent in the gable attic. The gable roof has a projecting overhang and is covered with asphalt shingles. Centered on the ridge is a gable-roofed cupola with a pair of arch-topped louvered vents on each side. Adjacent to the north of the barn is a concrete stave silo with a domed metal roof and an attached chute enclosure on the south side. The silo appears to have originally opened to the basement level of the barn below grade.

**Interior:**

The main level of the barn interior consists of a square rule post and beam frame. The bays are identified from south to north as Bays 1-5. The three southern bays, Bay 1 – Bay 3, comprise a traditional three-bay English barn frame with bay widths of 16'-7", 12', and 10'. The center of these bays, Bay 2, has the full-height barn door in the east wall. The bents are of hand-hewn timbers, with dropped tie-girts. The second interior bent (between Bay 1 and 2) has a single interior post off-center toward the west, while the remaining bents have a single interior post approximately centered. Vertical queen posts support longitudinal purlin plates. These carry hewn common rafters, which are mortised into a ridge pole. A hay track is extant below the ridge. The upper cross-tie girts appear to have been removed for clearance below the hay track, but have been replaced in recent rehabilitation work. The roof deck is wide random-width boards overlain by new plywood.

The northern bays, Bay 4 and Bay 5, appear to be of later construction. The plates in Bay 4 are jointed at the north face of the fourth bent, indicating that Bay 4 is an addition. The timbers forming Bays 4-5 are hand hewn but the rafters are sawn dimension lumber as is the floor framing below Bay 5, again indicating later construction. Bay 4 may be the first addition and Bay 5 a second addition, based on the floor framing, or both may have been concurrent, with later repairs of the roof and floor framing.

The basement level interior has mortared fieldstone retaining walls for the east and north sides. Most of the upper level is supported on east-west joists, which are a mix of hewn and un-dressed log timbers. These are carried on a pair of longitudinal hewn girders dividing the space into three aisles. The posts supporting the girders are modern wood heavy timbers, replacing the originals. The old ceiling material has a whitewash finish indicating its use as a dairy stable in the first half of the 20th century. The new posts are unfinished.

At the north end the last bay has a main level floor of sawn joists oriented north-south, indicating later construction. The floor is a concrete slab.

- Historical or Architectural importance:

Applicable Connecticut State Register Criteria:

1. Associated with the lives of persons significant in our past – history of immigrant farmers;
2. Embodying the distinctive characteristics of a type, period, or method of construction.

This farm and its barns are significant because they occupy a prime and highly visible gateway location along a designated state scenic road leading to Kent Village. The North Barn is an excellent intact example of its type, the
early 19th-century English barn, with changes over time including the extended length, cupola, and silo. The farm also represents the history of European immigrant farmers moving into the area in the early 20th century.

Historical background:
The barn is reported by local tradition to have been constructed in the early- to mid-1800s, certainly prior to the Civil War, although there is little documentation available about its provenance. The barn was reportedly used for tobacco farming and later dairy farming (Manley). It stands out as one of the very few barns in active agricultural use in the town (Smith).

It appears from the 1874 Beers map, that there may formerly have been a farmhouse located on the east side of the road, associated with the barns.

The North Barn’s English bank barn form is typical of early- to mid-19th-century family farms, with the banked basement often added by jacking up the main level frame to permit a stanchion layout which was the standard in the early 20th century. The cupola has a late 19th-century style with its arched louvers, while the concrete stave silo was a popular technology in the middle of the 20th century, after the 1940s.

The gambrel form of the South Barn suggests an early 20th-century date, when the construction of gambrel roofs with dimension lumber truss-work became common; however the structure is no longer exposed to view on the interior so it was not observed. An aerial view from the 1934 Fairchild photograph shows that the river’s course has narrowed and silted in, and although the resolution is grainy, it appears that there was only one barn at that time.

Former Kent Historical Society President, Susi Casey Williams, compiled a list of dairy farms that she can remember from her childhood “… Hilda Carlson’s farm (house on left, barns on right - which was the glassblower place until recently. It is now [since 1996] owned by the Kent Land Trust” (Williams).

The Carlsons grew some tobacco in addition to dairy; tobacco cultivation ended in Kent in the early 1930s in part due to the difficulty finding seasonal labor (Manley).

The Carlson family is recorded in the Census records of 1910 and 1920. Alfred Carlson, b. 1867, and Hannah, b. 1868, were natives of Sweden. Their oldest child, Anna had been born in Wisconsin in 1894, and they must have moved to Connecticut by 1897 as the second daughter, Hilda, was born in the state. Additional children Teresa, Frank, and Flora arrived by 1908. In 1910 Alfred was identified as a renter of farmland, but by 1920 he was a Dairy farmer, so must have acquired his farm. The Carlsons were followed by the Smallwood family and then by the glass-blowers mentioned by Williams.

Since acquisition by the Kent Land Trust in 1996, the South Barn has been renovated as Land Trust offices and a residence for Farmer Megan Haney, who leases the farm for a CSA and farm-stand, operating as Marble Valley Farm. The North Barn is used for farm activities and storage.

Architectural significance:
This farm and its barns are significant because they occupy a prime and highly visible gateway location near the southern edge of Kent, bordered by a designated state scenic road leading to Kent Village and the northwestern towns beyond. The Appalachian National Scenic Trail runs on the west side of the Housatonic River, which borders the site on the west. The site is within the Upper Housatonic Valley National Heritage Area, designated as a unit of the National Park System for its historical, cultural, and natural resources. The Town of Kent’s Plan of Conservation and Development identifies the southern gateway for prioritized conservation.

In addition to representing the historic landscape of agricultural Kent and protecting working farmland, the property’s North Barn is an excellent intact example of its type, the early 19th-century English barn. In this case the extended form and the banked basement and silo exemplify the changes over time that were typical of Connecticut farming, and illustrate the evolution from subsistence farming to commercial dairy farming.
